<sup>1</sup>The Regional Information Report Series was established in 1987 to provide an information access system for all unpublished divisional reports. These reports frequently serve diverse ad hoc informational purposes or archive basic uninterpreted data. To accommodate timely reporting of recently collected information, reports in this series undergo only limited internal review and may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without prior approval of the author or the of Commercial Fisheries Management and Development Division.

## ABSTRACT

During the 1995 Upper Cook Inlet, Alaska commercial salmon fishing season a test fishery was used to estimate the timing of the sockeye salmon *Oncorhynchus nerka*, run as it passed a transect along the southern boundary of the management area. The test fishery operated from 1 July to 30 July and captured 2,720 sockeye salmon representing 1,712 CPUE points. Mean date of the run was 15 July, and the test fishery encompassed approximately 93.7% of the total run.

KEY WORDS:      Salmon, *Oncorhynchus*, Upper Cook Inlet, Alaska, test fishery, migratory behavior

## INTRODUCTION

In 1979 the Alaska Department of Fish and Game (ADF&G) began a test fishing project near the southern boundary of the Upper Cook Inlet (UCI) salmon management area (Figure 1). The objective of this project was to estimate the total run of sockeye salmon *Oncorhynchus nerka*, to UCI before salmon reached commercial harvest areas. Such information has helped ADF&G management biologists set commercial fishing times and areas to harvest sockeye salmon surplus to spawning needs. Test fishing results have been reported annually since 1979 (Waltemyer 1983a, 1983b, 1986a, 1986b, Hilsinger and Waltemyer 1987, Hilsinger 1988, Tarbox and Waltemyer 1989, Tarbox 1990, 1992, 1994, 1995). This report presents the results of the 1995 test fishing project.

## METHODS

### *Test Fishing*

Sockeye salmon returning to Upper Cook Inlet were sampled by fishing geographically fixed stations between Anchor Point and Red River Delta (Figure 1). Stations were numbered consecutively from east to west. Station locations were determined from LORAN C coordinates. A chartered test fishing vessel sampled stations 4 - 8 daily. To increase sampling power an additional station (6.5) was sampled every other day.

Sampling started on 1 July and continued through 30 July. The chartered vessel, *F/V Corrina Kay*, fished 366 m (1,200 ft) of 2.1 cm (5 1/8 in) multifilament gill net during test fishing. Drift gill net web had a filament size number of 53/S6F, was 45 meshes deep, and was constructed of double knot Super Crystal shade number 1.

All salmon captured were identified to species. All sockeye salmon were measured for length (mid-eye to fork-of-tail in mm). The number of each species caught at each station was expressed as a catch per unit of effort (CPUE) statistic:

$$\text{CPUE}_s = \frac{100 \text{ fm} \times 60 \text{ min} \times \text{number of fish}}{\text{fm of gear} \times \text{MFT}}, \quad (1)$$

where: CPUE<sub>s</sub> = CPUE for station s, and  
MFT = mean fishing time.

Mean fishing time was calculated as:

$$MFT = (C - B) + \frac{[B - A] + [D - C]}{2}, \quad (2)$$

where: A = time net deployment started,  
B = time net fully deployed,  
C = time net retrieval started, and  
D = time net fully retrieved.

Once deployed at a station, gill nets were fished 30 min before retrieval started.

Daily CPUE ( $CPUE_d$ ) was calculated as:

$$CPUE_d = \sum_{s=1}^n CPUE_s \quad (3)$$

The following physical and chemical measurements were taken at the start of each set: air temperature, water temperature (at 1 m below the surface), wind velocity and direction, tide stage, water depth, and water clarity. Air and water temperatures were measured using a YSI salinity/temperature meter. Unfortunately, the salinity meter malfunctioned during the project. Wind speed was measured in knots and direction was recorded as 0 (no wind), 1 (north), 2 (northeast), 3 (east), 4 (southeast), 5 (south), 6 (southwest), 7 (west), or 8 (northwest). Tide stage was classed as flood, ebb or slack by observing the movement of the vessel while drifting with the gill net. Water depth was measured in fm using a Simrad echo sounder, and water clarity was measured in m using a 17.5 cm secchi disk.

### *Describing the Salmon Migration*

Catchability, the fraction of the available population taken by a defined unit of fishing effort, was estimated as:

$$q_d = c_d/r_d, \quad (4)$$

where:  $q_d$  = estimated catchability on day d,  
 $r_d$  = adjusted cumulative total return on day d, and  
 $c_d$  = cumulative CPUE on day d.

Passage rate, the expansion factor used to convert CPUE into estimated numbers of salmon passing the test fishing transect, was calculated as:

$$PR = 1/q_d = \text{passage rate} \quad (5)$$

Since the test fishery did not encompass the entire sockeye salmon run, the total CPUE for the test fishery was estimated after the season using the following relationship:

$$\text{CPUE}_t = \text{CPUE}_f \times \frac{H_t}{H_{(f+2)}}, \quad (6)$$

where:  $\text{CPUE}_t$  = total estimated CPUE for the season,  
 $\text{CPUE}_f$  = cumulative CPUE through final day, f, of test fishing,  
 $H_t$  = total commercial harvest for the season  
 $H_{(f+2)}$  = total commercial catch through final day of test fishery (f+2), and  
 $2$  = number of days it took salmon to travel from test fishery to commercial harvest areas.

Estimates of  $\text{CPUE}_t$  and  $\text{CPUE}_d$  values were used to estimate daily and cumulative proportions of  $\text{CPUE}_t$ , based on a non-linear model:

$$y_d = 1/(1 + e^{-(a+bd)}) \quad (7)$$

where:  $y_d$  = cumulative proportion of CPUE or return on day d,  
 $a$  and  $b$  = coefficients of model,  
 $d$  = day of observation.

To calculate mean date of return, the following formula was used:

$$M = a/b \quad (8)$$

where: M = mean date of return.

## RESULTS AND DISCUSSION

A total of 2,720 sockeye salmon, 155 pink salmon *O. gorbuscha*, 1129 chum salmon *O. keta*, 941 coho salmon *O. kisutch*, and 3 chinook salmon *O. tshawytscha*, were captured during the 1995 test fishery (Table 1, Appendices A-D). Daily sockeye salmon catches ranged from 4 to 600 fish (Table 1).

Sockeye salmon daily CPUE values ranged from 3.2 on 26 July to 269.7 on 15 July. Cumulative total CPUE for the duration of the project was 1,711.5 (Table 1). Using post season commercial harvest figures, test fishing spanned approximately 93.7% of the total run. Therefore, total CPUE for the test fishery would have been 1,827 if test fishing had continued throughout the duration of the run.

Sockeye salmon catches along the transect were similar to the distribution of CPUE values (Tables 2 and 3).

Examination of daily and cumulative proportions (estimated post season) of the sockeye salmon run to UCI suggested that 4.8% of the run had passed the transect prior to the start of test fishing on 1 July and that the run was 96% completed at project termination (Appendix E; Figure 2). The mean date of the run was 15 July which was on time relative to the historic average (Table 4).

The total sockeye salmon run to UCI in 1995 was estimated to be 4.6 million fish of which 2.9 million were harvested in the commercial fishery (Table 5). Estimated passage rate for the season was 2,517 sockeye salmon per CPUE index point.

Water temperatures measured along the transect generally increased during the season from a low of 7.0°C early in July to a high of 11.0°C toward the end of July (Appendix F). Air temperatures fluctuated between 11°C and 19°C during the project (Appendix F). Wind velocities were generally low to moderate. However, winds of 20 knots or greater were recorded on seven days (Appendix F). Wind direction was variable.

During the commercial salmon fishing season eight formal estimates of the sockeye salmon total run were made (Appendix G). Past studies suggested that the initial best fit estimate was not accurate in predicting total run during the season and that the second or third best fit estimate was usually more useful. This pattern was evident in 1995. However, the first estimates on 17 July

indicated a run between 4.6 and 5.9 million sockeye salmon. During the remainder of the season, the estimates generally indicated a run between 4 and 5 million fish (Appendix G).

The objective of the offshore test fish program is to provide UCI management biologists with early total run and timing estimates for sockeye salmon. This information, used with age, sex, size and stock identification data; harvest and escapement data; and observations on fishing patterns combine to formulate a management strategy during the fishing season. It is in this context that the data must be viewed.

The 1995 UCI commercial salmon fishery proceeded in an orderly fashion early in the season and run size estimates were not a significant factor until after 15 July (Ruesch, personal communication, ADF&G, Soldotna).

## **APPENDIX G**

UPPER COOK INLET RUN SUMMARY THROUGH 17 JULY 1995			
Commercial Harvest		1254000	
Residual in District		760000	
Escapement		240000	
Total		2254000	
Otf index		1181	
Passage Rate		1908.552	(note: passage rate on 10 July - 2300 on 14 July estimated 1809)
Run estimates			
1990		5900000	
1991		4600000	( note - all estimates of total index
1992		4900000	points are dropping which suggest that the estimates could be high)

UPPER COOK INLET RUN SUMMARY THROUGH 19 JULY 1995			
Commercial Harvest		1402877	
Residual in District		600000	
Escapement		400000	
Total		2402877	
Otf index		1256	
Passage Rate		1913.119	(note: passage rate on 10 July - 2300 on 14 July estimated 1809)
Run estimates			
1991	4500000		( note - all estimates of total index
1992	4700000		points are dropping which suggest that the estimates could be high)

UPPER COOK INLET RUN SUMMARY THROUGH 21 JULY 1995			
Commercial Harvest		1887000	
Residual in District		545000	
Escapement		525000	
Total		2957000	
Otf index		1373	
Passage Rate		2153.678	(note: passage rate on 10 July - 2300 on 14 July estimated 1809 on 17 July 1908)
Run estimates			
1983	1956	4212594	( note - all estimates except 1993 and 82-87 average of total index points are dropping which suggest
1986	2024	4359044	that the estimates could be high)
1987	2509	5403578	
1991	2235	4813471	
1992	2256	4858698	
1993	1779	3831393	
1994	2590	5578026	
1982-87	1971	4244899	

UPPER COOK INLET RUN SUMMARY THROUGH 23 JULY 1995								
Commercial Harvest		1904148						
Residual in District		500000						
Escapement		847000						
Total		3251148						
Otf index		1566						
Passage Rate		2076.084		(note: passage rate on 10 July - 2300 on 14 July estimated 1809 on 17 July 1908)				
Run estimates								
1983	1938	4023451	-10	( note - all estimates except 1993 and 82-87 average of total index				
1986	2015	4183310	-7	points are dropping which suggest				
1987	2431	5046961	-3	that the estimates could be high; 1983 best estimate)
